Power BI Banking Dashboard

A comprehensive analytics solution for financial performance tracking and strategic decision-making

- By Oishee Majumder

About the Project

This banking dashboard project leverages a comprehensive banking dataset to deliver actionable insights through interactive visualizations. The dashboard serves as a centralized platform for monitoring key performance indicators, analyzing customer behavior, and tracking financial metrics across multiple dimensions.

Loan Analysis

Detailed breakdown of loan portfolios, income band distributions, and lending patterns across geographic regions

Deposit Analysis

Comprehensive tracking of deposit accounts, savings patterns, and currency diversification strategies

Dataset Summary

Executive-level overview of all financial metrics, customer engagement, and operational performance indicators

The dashboard enables stakeholders to drill down into specific metrics, identify trends over time, and compare performance across different customer segments. By integrating multiple data sources into a single, intuitive interface, this solution eliminates the need for manual report compilation and provides real-time visibility into critical banking operations.

Made with GAMMA

Key Performance Indicators

The dashboard tracks three critical engagement metrics that provide insight into customer relationship depth and product adoption rates across the banking portfolio.

188

Total Clients

Active customer base across all banking products and services

$18.26K

Total Engagement Account

Combined value across engagement accounts demonstrating active customer participation

$135

Total CC Account

Aggregate value tracked across credit card accounts in the system

These foundational metrics establish the baseline for customer engagement analysis. The Total Clients figure represents the entire customer base available for cross-selling and retention initiatives. Engagement Account values reflect customers who actively use multiple banking products, indicating higher lifetime value potential. Credit Card Account metrics provide insight into revolving credit utilization patterns and fee generation opportunities.

Financial Goals Overview

Strategic targets encompassing the three primary revenue streams that drive banking profitability and market competitiveness.

Total Loan Portfolio

Aggregate lending volume across all income bands and geographic markets

Total Deposit Base

Combined savings and checking account balances providing funding liquidity

Total Fee Revenue

Service charges, transaction fees, and account maintenance income streams

Loan Portfolio Insights

The $139.9M loan portfolio represents the bank's largest asset class, generating interest income while managing credit risk exposure. This figure includes consumer loans, mortgages, and business lending products distributed across varying risk profiles.

Deposit Base Analysis

With $111.49M in deposits, the bank maintains a healthy loan-to-deposit ratio, ensuring sufficient liquidity for daily operations while minimizing reliance on wholesale funding sources. The mix includes transactional and savings accounts.

Fee Revenue Stream

The $5.17M in fees provides non-interest revenue diversification, including service charges, ATM fees, overdraft charges, and account maintenance fees. This stream demonstrates stable recurring revenue independent of interest rate fluctuations.

Bank Financial Performance

Bank Loan

$55.5M

Total outstanding loan balances across all customer segments and product types

Bank Deposit

$60.18M

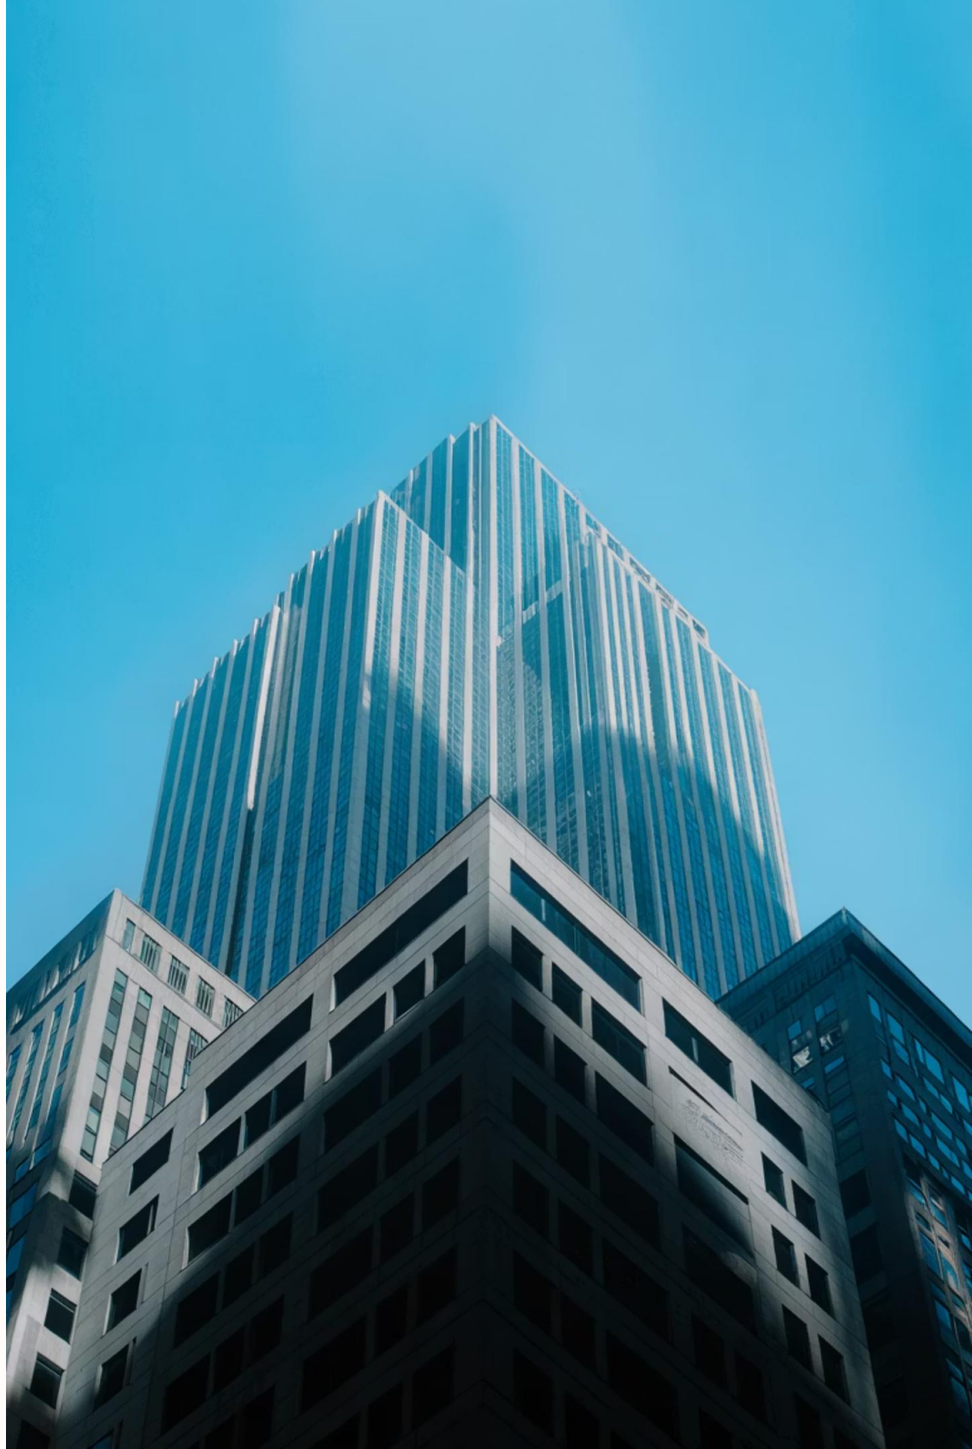
Combined checking and savings account balances providing funding stability

Business Lending

$83.52M

Commercial loans supporting corporate clients and small business operations

These three metrics reveal the bank's strategic focus on commercial lending, where the $83.52M business lending portfolio significantly exceeds consumer loan and deposit volumes. The deposit base of $60.18M comfortably funds the $55.5M in consumer loans, maintaining a conservative liquidity position. Business lending represents the growth engine, targeting higher-margin commercial relationships while managing increased credit risk through enhanced underwriting standards.



Account Balances Breakdown

Detailed analysis of transactional and savings account balances, including foreign currency holdings that reflect the bank's international customer base.

$19.85M

Saving Account

Total balances held in savings accounts demonstrating customer preference for interest-bearing deposits

$2.71M

Foreign Currency Amount

Combined value in foreign currencies providing diversification benefits and international exposure

Savings accounts represent a significant portion of the deposit base at $19.85M, indicating customers' preference for liquidity with modest interest earnings. Foreign currency holdings of $2.71M suggest a meaningful international customer segment conducting cross-border transactions or holding diversified currency positions. These figures should be tracked over time to identify shifts in customer behavior and currency preferences.

Made with GAMMA

$2.71M

Foreign Currency Amount

Total value held in foreign currencies across customer accounts, measured in millions of dollars.

Foreign currency holdings represent 2.4% of the total deposit base, indicating a specialized service line serving international customers, expatriates, or businesses with foreign exchange needs. This segment may present opportunities for growth through targeted foreign exchange services, multi-currency accounts, and international wire transfer facilitation. Monitoring currency mix and conversion patterns can inform hedging strategies and identify cross-selling opportunities for treasury management services.

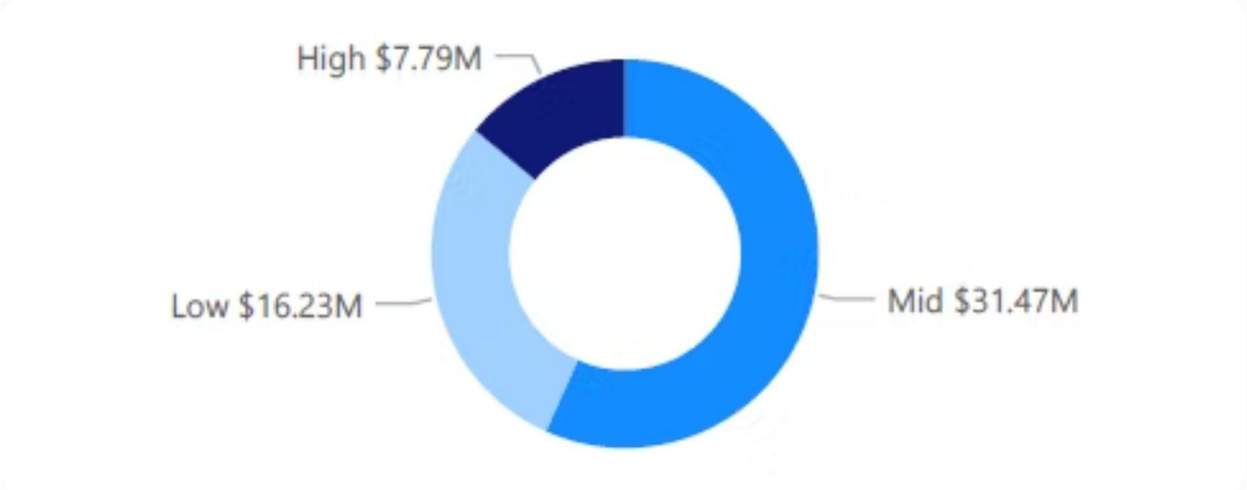
Bank Loan Distribution by Income Band



Key Observations

Mid Income Dominance

Mid income band shows the highest loan volume, likely reflecting optimal balance between creditworthiness and borrowing capacity. This segment represents the bank's core lending opportunity.

High Income Paradox

Surprisingly, high income band shows the lowest loan volume despite superior credit profiles. This may indicate self-financing behavior, alternative lending sources, or under-penetration in premium segments.

Strategic Implications

Consider targeted outreach to high income customers for mortgage refinancing, home equity lines, or investment property financing. Evaluate mid income segment for portfolio concentration risk.

The income band analysis reveals counterintuitive patterns that warrant deeper investigation. While mid income customers demonstrate expected borrowing behavior, the low penetration among high income segments suggests missed opportunities. Possible explanations include customer satisfaction with existing lenders, inadequate product offerings for premium segments, or insufficient relationship management. The bank should conduct customer surveys and competitive analysis to identify barriers and develop targeted strategies for high-value customer acquisition.

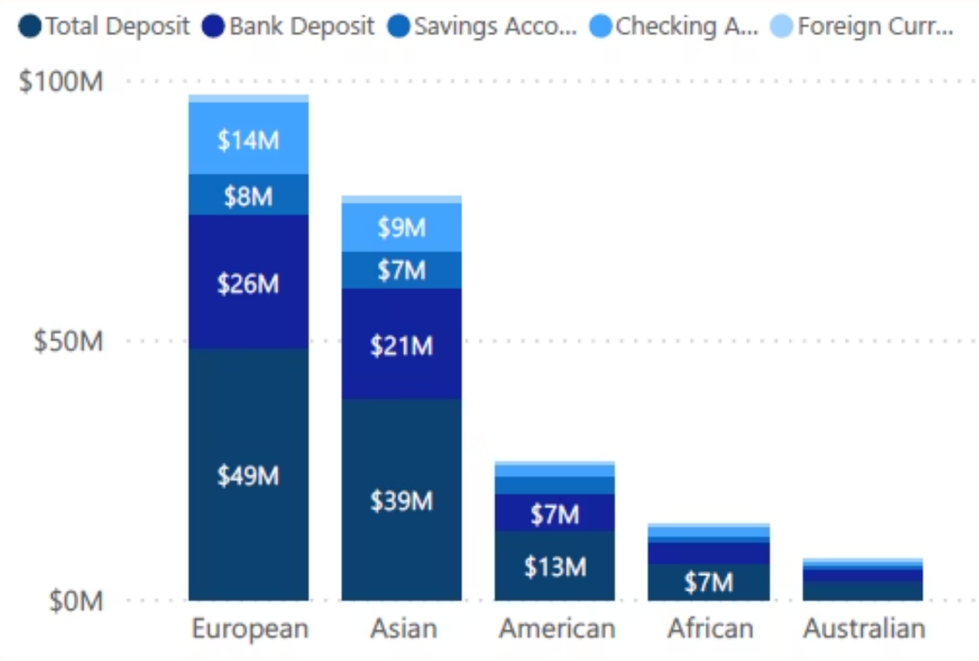
Bank Loan by Region

Geographic Distribution Patterns



European Countries

Highest loan features, likely due to mature banking infrastructure and strong customer relationships

Asian Countries

Second-highest features, showing growth potential in emerging markets with increasing banking penetration

African Countries

Lower features, potentially limited by infrastructure constraints and lower banking penetration rates

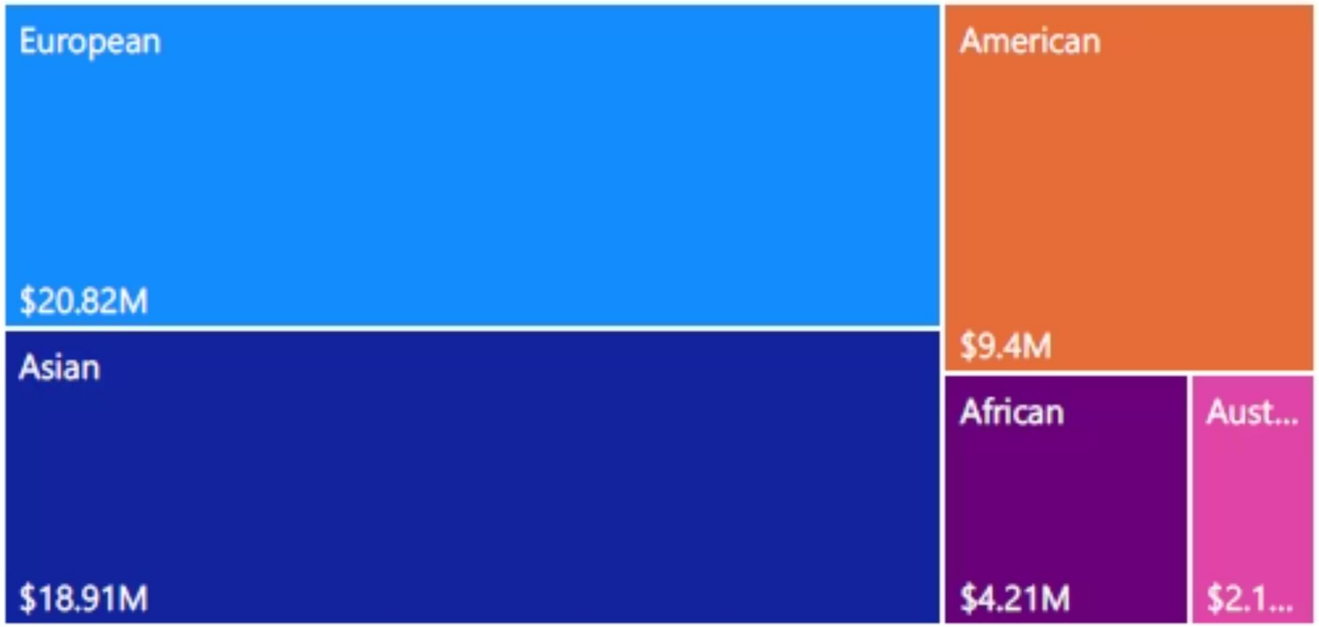
Australian Countries

Lowest features, possibly due to market saturation or competitive intensity from local banks

The geographic analysis demonstrates clear regional disparities in loan feature adoption. European markets lead with established customer relationships and comprehensive product penetration. Asian markets follow with strong growth trajectories as banking infrastructure expands. African regions face structural barriers including limited infrastructure and lower financial literacy, while Australian markets may be constrained by competitive dynamics or different customer preferences. These patterns suggest opportunities for targeted regional strategies, including infrastructure investment in African markets, accelerated product rollout in Asian regions, and competitive positioning adjustments in Australia.

Made with GAMMA

Bank Loan by Nationality



Key Findings

European countries demonstrate the highest loan features

Established banking relationships and comprehensive product adoption drive elevated feature usage across European nationalities

Australian countries show the lowest loan features

Market saturation, competitive positioning, or alternative financing preferences may explain reduced feature adoption among Australian customers

Nationality-based analysis confirms the geographic patterns observed in previous charts, with European customers leading in feature adoption and Australian customers trailing significantly. This data should be analyzed in conjunction with customer lifetime value metrics to determine whether geographic disparities represent revenue opportunities or reflect underlying customer behavior patterns. Consider overlaying demographic and economic data to identify causation versus correlation in these regional differences.
